Art Unit: 2614

DETAILED ACTION

Claim Rejections - 35 USC § 102

1. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless -

- (e) the invention was described in (1) an application for patent, published under section 122(b), by another filed in the United States before the invention by the applicant for patent or (2) a patent granted on an application for patent by another filed in the United States before the invention by the applicant for patent, except that an international application filed under the treaty defined in section 351(a) shall have the effects for purposes of this subsection of an application filed in the United States only if the international application designated the United States and was published under Article 21(2) of such treaty in the English language.
- 2. Claims 1 and 2 are rejected under 35 U.S.C. 102(e) as being anticipated by Zigmond et al. (Zigmond) (6,692,020).

As to claim 1, Zigmond discloses a method of selecting and displaying a video segment to a viewer (column 6, lines 4-12) comprising:

transmitting a plurality of video segments (advertisements) from a broadcast center to a viewer (Fig. 6, steps 100-106; column 16, lines 44-56);

displaying said video segments to said viewer (column 7, lines 26-36);

sensing viewer reaction input to said displayed video segments from said viewer (viewer actions during or after an ad; Fig. 6, step 118; column 9, lines 23-30) through at least one sensor (monitoring inherently involves a sensor for detecting or measuring the viewer actions; column 9, lines 23-30) after receiving a start trigger (wherein the ad is displayed after a trigger; Fig. 6, steps 112 and 114; column 8, lines 33-38);

transmitting said input to a remote computer (column 9, lines 45-52);

Art Unit: 2614

analyzing said input to generate affinity data (wherein all user data is combined to find ad parameters corresponding to the viewer; column 9, lines 52-55 and column 11, lines 31-49);

selecting a specific video signal based on said affinity data (wherein an ad is found best matching the viewer; Fig. 6, step 110; column 11, lines 42-49)

displaying said specific video signal to said viewer (Fig. 6, step 116; column 17, lines 27-31).

As to claim 2, Zigmond discloses wherein said sensor comprises at least one button pressed by a viewer (wherein viewer channel changes, requests and feedback would inherently involve pressing a button; column 9, lines 23-30).

Claim Rejections - 35 USC § 103

- 3. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:
 - (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.
- 4. Claims 4 and 5 are rejected under 35 U.S.C. 103(a) as being unpatentable over Zigmond et al. (Zigmond) (6,692,020) in view of Alexander et al. (Alexander) (6,177,931).

As to claim 4, Zigmond discloses a method of collecting affinity data (column 9, lines 21-30) comprising:

Art Unit: 2614

transmitting a plurality of video segments (advertisements) from a broadcast center to a viewer (Fig. 6, steps 100-106; column 16, lines 44-56);

displaying said video segments to said viewer (column 7, lines 26-36);

sensing viewer reaction input to said displayed video segments from said viewer (viewer actions during or after an ad; Fig. 6, step 118; column 9, lines 23-30) through at least one sensor (monitoring inherently involves a sensor; column 9, lines 23-30) after receiving a start trigger (wherein the ad is displayed after a trigger; Fig. 6, steps 112 and 114; column 8, lines 33-38);

analyzing said input to generate affinity data (wherein all user data is combined to find ad parameters corresponding to the viewer; column 9, lines 52-55 and column 11, lines 31-49);

selecting a specific video signal based on said affinity data (wherein an ad is found best matching the viewer; Fig. 6, step 110; column 11, lines 42-49)

displaying said specific video signal to said viewer (Fig. 6, step 116; column 17, lines 27-31).

While Zigmond discloses analyzing said input to generate affinity data, he fails to specifically disclose transmitting the affinity data to a remote computer.

In an analogous art, Alexander discloses a system wherein an EPG will monitor and record all user interactions during television programming (column 28, lines 30-44), analyze the viewer information to create a profile (column 29, lines 14-30) and report the profile (or affinity data) to a headend or advertiser (column 33, lines 9-15) for the typical benefit of providing the data to advertisers for statistical analysis, customized

Art Unit: 2614

marketing, narrowcasting opportunities and to determine program requirements (column 33, lines 9-15).

It would have been obvious to one of ordinary skill in the art at the time of invention by applicant to modify Zigmond and Kamada's system to include transmitting the affinity data to a remote computer, as taught by Alexander, for the typical benefit of providing the data to advertisers for statistical analysis, customized marketing, narrowcasting opportunities and to determine program requirements.

As to claim 5, Zigmond and Alexander disclose wherein said sensor comprises at least one button pressed by a viewer (wherein viewer channel changes, requests and feedback would inherently involve pressing a button; see Zigmond at column 9, lines 23-30).

5. Claim 13 is rejected under 35 U.S.C. 103(a) as being unpatentable over Zigmond et al. (Zigmond) (6,692,020) in view of Shah-Nazaroff (6,317,881) (previously presented).

As to claim 13, Zigmond discloses a method of providing broadcast content viewing information (column 9, lines 21-30) comprising:

transmitting a start trigger (column 8, lines 33-54);

receiving responses to said presentation of said broadcast content from said viewers (column 3, lines 32-47) after said start trigger is received (wherein the ad starts displaying after the trigger; Fig. 6, steps 112 and 114; column 8, lines 33-38);

Page 6

analyzing said responses received from said viewers (wherein all user data is combined to find ad parameters corresponding to the viewer; column 9, lines 52-55 and column 11, lines 31-49); and

generating affinity data from said analysis (wherein all user data is combined to find ad parameters corresponding to the viewer; column 9, lines 52-55 and column 11, lines 31-49).

While Zigmond discloses providing broadcast content viewing information, he fails to specifically disclose implementing an award method wherein viewers are awarded a value for responding to events associated with presentation of said broadcast content.

In an analogous art, Shah-Nazaroff discloses a broadcast system (Fig. 1) implementing an award method (column 3, lines 33-40) wherein viewers are awarded a value for responding to events associated with presentation of said broadcast content (column 3, lines 33-47) for the benefit of encouraging more user feedback (column 3, lines 33-36).

It would have been obvious to one of ordinary skill in the art at the time of invention by applicant to modify Zigmond's system to include an award method wherein viewers are awarded a value for responding to events associated with presentation of said broadcast content, as taught by Shah-Nazaroff, for the typical benefit of encouraging more user feedback from broadcast television viewers.

Art Unit: 2614

6. Claim 3 is rejected under 35 U.S.C. 103(a) as being unpatentable over Zigmond as applied to claim 1 above, and further in view of Hite (6,002,393) (previously presented).

As to claim 3, while Zigmond discloses the selecting of a video signal during a broadcast based upon affinity data, he fails to specifically disclose the selection of a video signal during a live broadcast.

In an analogous art, Hite discloses a cable receiver (Fig. 5) wherein a specific commercial segment is selected for insertion during live broadcasts (column 13, lines 7-18) based upon compiled user statistics (column 7, lines 7–35) for the typical benefit of allowing the display of targeted video during sports contests and other live events (column 13, lines 7-18).

It would have been obvious to one of ordinary skill in the art at the time of invention by applicant to modify Zigmond's system to include the selecting of a video segment during a live broadcast, as taught by Hite, for the typical benefit of allowing a user's affinity for a specific video to be used to display a targeted video during sports contests and other live events.

7. Claims 14, 16 and 18 are rejected under 35 U.S.C. 103(a) as being unpatentable over Zigmond as applied to claim 1 above, and further in view of Scarampi (4,931,865).

As to claim 14, while Zigmond discloses a sensor, he fails to specifically disclose wherein said sensor is a biometric sensor.

Art Unit: 2614

In an analogous art, Scarampi discloses a system (Fig.1) for monitoring a television viewer (column 2, lines 26-35) wherein eye position, pupil dilation and other biofeedback variables are monitored (column 5, lines 62-68 and column 6, lines 1-3) using audio (sound; column 6, lines 48-53) for the benefit of indicating information on a viewer's degree of interest in and emotional response to programming (column 6, lines 1-3).

It would have been obvious to one of ordinary skill in the art at the time of invention by applicant to modify Zigmond's system to include wherein said sensor is a biometric sensor, as taught by Scarampi, for the benefit of providing information on a viewer's degree of interest in and emotional response to programming.

As to claim 16, while Zigmond discloses a sensor, he fails to specifically disclose wherein said sensor is an audio sensor.

In an analogous art, Scarampi discloses a system (Fig.1) for monitoring a television viewer (column 2, lines 26-35) wherein eye position, pupil dilation and other biofeedback variables are monitored (column 5, lines 62-68 and column 6, lines 1-3) using audio (sound; column 6, lines 48-53) for the benefit of indicating information on a viewer's degree of interest in and emotional response to programming (column 6, lines 1-3).

It would have been obvious to one of ordinary skill in the art at the time of invention by applicant to modify Zigmond's system to include wherein said sensor is a

Art Unit: 2614

audio sensor, as taught by Scarampi, for the benefit of providing information on a viewer's degree of interest in and emotional response to programming.

As to claim 18, while Zigmond discloses a sensor, he fails to specifically disclose wherein said sensor is an infrared sensor.

In an analogous art, Scarampi discloses a system (Fig.1) for monitoring a television viewer (column 2, lines 26-35) wherein eye position, pupil dilation and other biofeedback variables are monitored (column 5, lines 62-68 and column 6, lines 1-3) using infrared (infrared range light; column 6, lines 48-53) for the benefit of indicating information on a viewer's degree of interest in and emotional response to programming (column 6, lines 1-3).

It would have been obvious to one of ordinary skill in the art at the time of invention by applicant to modify Zigmond's system to include wherein said sensor is a infrared sensor, as taught by Scarampi, for the benefit of providing information on a viewer's degree of interest in and emotional response to programming.

8. Claims 15 and 17 are rejected under 35 U.S.C. 103(a) as being unpatentable over Zigmond as applied to claim 1 above, and further in view of Lu et al. (Lu) (5,771,307).

As to claim 15, while Zigmond discloses a sensor, he fails to specifically disclose wherein said sensor is a motion sensor.

Art Unit: 2614

In an analogous art, Lu discloses a system (Fig.3) for monitoring a television viewer (column 3, lines 28-43) wherein a motion sensor is used to monitor people in the viewing area (column 8, lines 59-62) for the benefit of identifying the number of and identify of television viewers (column 8, lines 59-62 and column 19, lines 55-59).

It would have been obvious to one of ordinary skill in the art at the time of invention by applicant to modify Zigmond's system to include wherein said sensor is a motion sensor, as taught by Lu, for the benefit of identifying the number of and identity of viewers in a broadcast television system.

As to claim 17, while Zigmond discloses a sensor, he fails to specifically disclose wherein said sensor is a video sensor.

In an analogous art, Lu discloses a system (Fig.3) for monitoring a television viewer (column 3, lines 28-43) wherein video cameras capture images of a viewing area (column 9, lines 30-35) which are used for facial recognition (column 9, lines 59-67) for the benefit of enabling television viewers to be identified using video images.

It would have been obvious to one of ordinary skill in the art at the time of invention by applicant to modify Zigmond's system to include wherein said sensor is a video sensor, as taught by Lu, for the benefit of enabling a system to identify broadcast television viewers through the use of video images.

9. Claim 6 is rejected under 35 U.S.C. 103(a) as being unpatentable over Zigmond and Alexander as applied to claim 4 above, and further in view of Hite.

Art Unit: 2614

As to claim 6, while Zigmond and Alexander disclose the selecting of a video signal during a broadcast based upon affinity data, they fail to specifically disclose the selection of a video signal during a live broadcast.

In an analogous art, Hite discloses a cable receiver (Fig. 5) wherein a specific commercial segment is selected for insertion during live broadcasts (column 13, lines 7-18) based upon compiled user statistics (column 7, lines 7–35) for the typical benefit of allowing the display of targeted video during sports contests and other live events (column 13, lines 7-18).

It would have been obvious to one of ordinary skill in the art at the time of invention by applicant to modify Zigmond and Alexander's system to include the selecting of a video segment during a live broadcast, as taught by Hite, for the typical benefit of allowing a user's affinity for a specific video to be used to display a targeted video during sports contests and other live events.

10. Claim 19 is rejected under 35 U.S.C. 103(a) as being unpatentable over Zigmond as applied to claim 1 above, and further in view of Henderson et al. (Henderson) (5,603,078).

As to claim 19, while Zigmond discloses a sensor (sensing user channel changes; column 9, lines 26-30), he fails to specifically disclose wherein said sensor is a keypad.

In an analogous art, Henderson discloses a video system (Fig. 1; column 4, lines 31-42) wherein user inputs (such as channel change commands) are entered via a

Page 12

keypad (column 5, lines 22-30) for the typical benefit of utilizing a well-known keypad device to allow a user to enter commands (column 5, lines 22-30).

It would have been obvious to one of ordinary skill in the art at the time of invention by applicant to modify Zigmond's system to include wherein said sensor is a keypad, as taught by Henderson, for the typical benefit of utilizing a well-known keypad device for the entry of a television viewers input.

Response to Arguments

11. Applicant's arguments with respect to claims 1-19 have been considered but are most in view of the new ground(s) of rejection.

Conclusion

12. Applicant's amendment necessitated the new ground(s) of rejection presented in this Office action. Accordingly, **THIS ACTION IS MADE FINAL**. See MPEP § 706.07(a). Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire THREE MONTHS from the mailing date of this action. In the event a first reply is filed within TWO MONTHS of the mailing date of this final action and the advisory action is not mailed until after the end of the THREE-MONTH shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of

Application/Control Number: 10/046,618 Page 13

Art Unit: 2614

the advisory action. In no event, however, will the statutory period for reply expire later than SIX MONTHS from the date of this final action.

13. The following are suggested formats for either a Certificate of Mailing or Certificate of Transmission under 37 CFR 1.8(a). The certification may be included with all correspondence concerning this application or proceeding to establish a date of mailing or transmission under 37 CFR 1.8(a). Proper use of this procedure will result in such communication being considered as timely if the established date is within the required period for reply. The Certificate should be signed by the individual actually depositing or transmitting the correspondence or by an individual who, upon information and belief, expects the correspondence to be mailed or transmitted in the normal course of business by another no later than the date indicated.
